RESEARCH OBJECTIVE

To explore consumers' decision-making process when purchasing electronics, understanding brand preferences and the influence of online research on in-store purchases

SAMPLE SIZE

- Surveys completed: 2000
- Observational research: 100 hours

TARGET

- Store Selection Method: Chose major electronics retail chains and smaller specialised stores across diverse locations, including malls and standalone outlets
- Respondent Selection Method: We conducted intercept interviews with shoppers at selected stores. Additionally, an online panel of electronics purchasers provided supplementary data

METHODOLOGY ADOPTED

We used a combination of surveys and observational research. Surveys focused on purchase behaviours, brand perceptions, and the role of online reviews, while observational research tracked how shoppers interacted with products in-store

RESULTS

We highlighted the significant influence of online reviews and research on the decision-making process before making in-store purchases. Despite online research, consumers still valued the tactile experience of physically interacting with electronics before buying

CHALLENGES FACED

Difficulty accessing real-time data due to fluctuations in product availability and high store foot traffic. It is maintaining consistency in survey responses between online and in-store participants
