RESEARCH OBJECTIVE

To understand consumer behaviour and preferences towards health and wellness products in urban and suburban areas, identifying key purchase influencers and shopping patterns

SAMPLE SIZE

- Surveys completed: 1500
- In-depth interviews conducted: 50

TARGET

- Store Selection Method: We selected a mix of health food stores, pharmacies, and supermarkets known for their extensive health and wellness sections in urban and suburban locations
- Respondent Selection Method: We conducted intercept and online surveys targeting shoppers at selected stores. Participants were chosen randomly, ensuring a diverse demographic representation

METHODOLOGY ADOPTED

We used surveys and in-depth interviews to gather quantitative and qualitative data. Surveys covered shopping habits, product preferences, and purchase motivations, while interviews delved deeper into attitudes and influences

RESULTS

Identified that in urban areas, convenience and product variety were significant factors influencing purchases, while in suburban areas, trust in product quality and health benefits were more critical. Additionally, a notable shift towards natural and organic products was observed across both locations

OPERATIONAL CHALLENGES

Difficulty in reaching certain demographics, such as older age groups or specific ethnicities, and maintaining engagement during more extended interviews were encountered
