METHODOLOGY ADOPTED

The methodologies adopted
for this project include:

- 1. Email Sampling**
- 2. Phone-to-Web
Recruitment**

STUDY BACKGROUND

This study targeted almost all the MDs (GP/FMs and Specialists) across Canada. We have 314 respondents who responded online to the survey over 22 business days.

The survey was conducted to understand the Physicians' financial goals and investment plans. We received over 90% of samples online and 10% from the Phone-to-Web recruitment team.

After completion, incentives are given to encourage participation in the online section of the study and to acknowledge the worth of participants' time.

BUSINESS OBJECTIVE

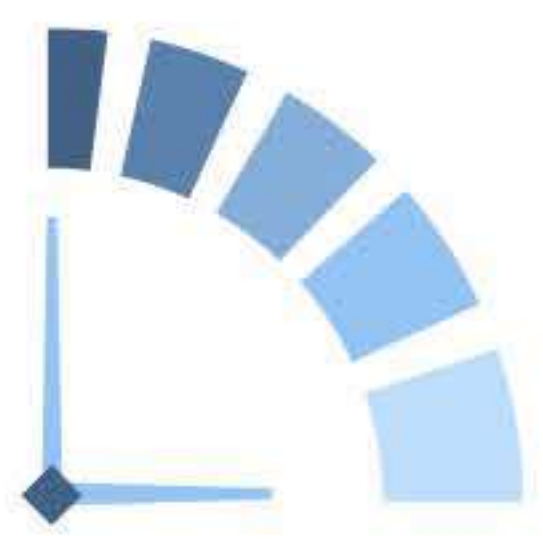

For every business, the major objective is to make profits. Hence, here we aim at increasing the profit by controlling the costs of operations and cost per interview. Also, this is a competitive industry among research vendors where you earn based on the number of respondents that have completed any given survey. It is logical for us to aim at achieving maximum completion to make more profit.

DATA COLLECTION**

RESEARCH OBJECTIVE

This research was focused on how physicians have structured their finances and how they are preparing for future retirement. The survey was designed to understand Physicians' financial goals for retirement and to understand the type of personal accounts they use to invest their savings and to know the financial planning advice they currently use. Since the risk of running out of retirement savings is top of mind for many Canadians, a new financial plan only for MDs is introduced which provides a lifetime pension based on personal earnings. This new pension plan offers physicians a unique opportunity for predictable lifetime retirement income that complements a broader wealth accumulation strategy. Incorporated physicians will have an opportunity for an added layer of peace of mind knowing they can plan for a predictable income stream in retirement including protection for their family.

OPERATIONAL CHALLENGES

While completing this project, we encountered a few challenges. The basic objective of this research was to understand the financial goals of the MDs after retirement and to introduce a new investment plan. Questions were asked about Physicians' investment plans and total asset value which physicians usually do not like to disclose this information. We did not find it difficult to get 150 specialists, since we were targeting all the specialists and had huge data. However, we struggled a bit to reach the GP/FM quota when the regions came into the picture. Bringing in the QC respondents was a bit difficult but with the support of the referral program and with the assistance of the CATI team, we achieved the quoted number of completes.

OUR APPROACH TO OPERATIONAL CHALLENGES

We started with an email invitation and then moved on to P2W. Instead of blasting invitations to every potential respondent, we invited them in batches because we had a lot of data. We soft-launched the study to make sure that everything is operating as it should. The client requested to invite various specialists rather than having a greater number of the same specialists. Hence, we invited a wide range of specialists. At a point in time when we met quotas in certain regions and needed completes from particular regions. We implemented the P2W efforts and planned to implement the faxes in case of the of slow movement. We started a referral campaign which helped us to close the project on schedule.

EXECUTIVE SUMMARY

The goal of this project was to introduce a high-quality pension plan to Physicians in Canada. The project was quoted to get 300 Physicians on board. Questionnaires were prepared to better understand the Physicians' financial goals and investment plans. I was a bit concerned as a project manager because of the questionnaires asking about personal finances. Launched the project hoping to get maximum completion. With the data we had, the soft launch was successful. However, it was a bit difficult when the regions came into the picture but with the support of the referral program and the assistance of the CATI team, we fulfilled the quota and completed the project on schedule. In this survey respondents may have been exposed to information that is considered to be proprietary and confidential. The information was being shared for research purposes only.
