In-Depth  
Interviews (IDI).**

## STUDY BACKGROUND

To deliver a clear foundation for CI [Cochlear Implant] product development and market strategies that could change the behaviors of customers and channel partners for commercial advantage.

## TARGET RESPONDENT

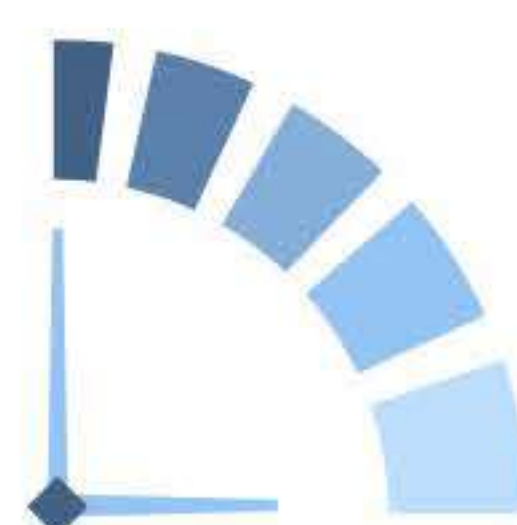

The target respondent age group included:  
3 respondents between 0 – 5 years old  
3 respondents between 6 – 15 years old

Adult recipients as well as the parents of pediatric recipients (aged 0-15 years old) would be happy to share their experiences of receiving an implant.

## BUSINESS OBJECTIVE

To identify the key areas of met and unmet recipient needs and understand how recipients could be segmented into different groups to enable targeted service offerings in the future.

## TIMELINE

It took 3 weeks to complete the study.

## SAMPLE SIZE

We recruited 6 pediatric respondents [parents] from the client's database, scheduled the interview, and discussed with them.

## OPERATIONAL CHALLENGES

- Initially we faced difficulty in contacting the respondents as most of the respondents were busy and not interested in proceeding further
- However post multiple calls with the respondents, we got 3 respondents on board with whom the IDI was completed along with pre-interview tasks
- Most of the respondents were not able to express many details as they felt emotional about the whole journey as they seemed to learn to live with the hearing loss and were not interested in looking back on the experience carefully

## OUR APPROACH TO OPERATIONAL CHALLENGES

As there was not much response from the database, we did secondary research to recruit the respondents for the IDI.

Final Report

## EXECUTIVE SUMMARY

Post the IDI with all 6 respondents we concluded, that respondents needed more help from professionals such as experts in the hospitals and cochlear companies in each stage especially after they had a diagnosis of hearing loss and were going to choose a solution.
