METHODOLOGY
ADOPTED

The methodologies adopted for this project include:

- Email sampling
- Phone-to-web recruitment

MRHCPM151124

Dentists

TARGET
RESPONDENTS

STUDY BACKGROUND

This study targeted dentists across the USA, with 301 respondents completing the survey online over a period of 15 business days, from August 6th, 2024, to August 26th, 2024.

This study was focused on patients who came to their dentists with recommendations or feedback on products they have used for mouthwash or mouth rinse brands. Over 95% of the sample was obtained online, and the remaining 5% came from the phone-to-web recruitment team.

After completion, incentives were given to encourage participation in the online section of the study and to acknowledge the value of participants' time.

BUSINESS OBJECTIVE

The major objective of every business is to make profits. Here, we aim to increase profit by controlling operational costs and the cost per interview. In this competitive research industry, where earnings depend on the number of survey completions, it is logical to aim for maximum completions to increase profitability.

OPERATIONAL CHALLENGES

While successfully completing this project, we encountered a few challenges related to quotas for age, gender, and region. We achieved the required number of male respondents, but reaching the quota for female respondents was more challenging. However, with various strategies, we successfully met the required completions for each sub-quota.

OUR APPROACH TO OPERATIONAL CHALLENGES

We began with email invitations, followed by P2W recruitment. Instead of blasting invitations to every potential respondent, we sent them in batches, given the extensive data available. We softly launched the study to ensure smooth operation. When quotas were met in certain regions, ages, and genders, but additional completions were needed for specific demographics, we intensified P2W efforts and considered using fax outreach in case of slow responses. A referral campaign helped us close the project on schedule.

EXECUTIVE SUMMARY

The goal of this project was to focus on patients who come to their dentists with recommendations or feedback on products they have used for mouthwash or mouth rinse brands. The target was to recruit 300 dentists, though fulfilling quotas and sub-quotas presented some concerns. The project was launched hoping to get maximum completion. With the data we had, the soft launch was successful. Age and regional quotas introduced some difficulties; however, with support from the referral program and CATI assistance, we completed the study successfully and on time.

In this survey, respondents may have been exposed to information that is considered to be proprietary and confidential, which was shared strictly for research purposes.

CLIENT FEEDBACK

The client appreciated our efforts, especially since we closed the study ahead of the deadline.
