**GPs – 75,
Nurse Practitioners – 25**

TARGET
RESPONDENTS

STUDY BACKGROUND

This study targeted GPs and Nurse Practitioners across the Ontario region in Canada. A total of 105 respondents participated in the online survey over a period of 21 business days, from September 25, 2024, to October 25, 2024. The purpose of this research was to better understand attitudes and awareness regarding HIV prevention and care. Participants completed a 10-minute survey, and incentives were provided to encourage participation and to acknowledge the value of their time in contributing to the study.

BUSINESS OBJECTIVE

For every business, the primary objective is to generate profit. In this case, our goal is to increase profitability by managing operational costs and reducing the cost per interview. Given the competitive nature of the research industry—where revenue is earned based on the number of completed surveys—it is logical to focus on achieving the maximum number of completions to maximize profit.

SAMPLE SIZE

**GPs – 78,
Nurse Practitioners – 100**

RESEARCH OBJECTIVE

To inform the physician outreach strategy for the Ontario HIV Treatment Network (OHTN) by educating, engaging, and supporting healthcare professionals with actionable recommendations for campaign targeting.

OPERATIONAL CHALLENGES

Initially, the client requested that the study topic not be mentioned in the email invitation. While this did not significantly hinder our ability to achieve 78, as we targeted a broad audience including GPs, Family Medicine, and Internal Medicine professionals with a substantial database, we faced some difficulty reaching Nurse Practitioners. This was because we were targeting only Nurse Practitioners from the Ontario region. Midway through the survey, the client decided to focus solely on Nurse Practitioners rather than including nurses in general. Despite this shift, with the help of data mining, a referral program, and P2W efforts, we successfully achieved the required number of completes.

OUR APPROACH TO OPERATIONAL CHALLENGES

We began with email invitations and later incorporated P2W efforts. Instead of sending invitations to all potential respondents at once, we invited them in batches, leveraging the large amount of data we had for GPs. To ensure everything was functioning properly, we conducted a soft launch of the study. Following this, we implemented P2W efforts and planned to use customized invitations as a contingency in case of slow progress. Additionally, we launched a referral campaign, which proved instrumental in helping us complete the project on schedule.

EXECUTIVE SUMMARY

The purpose of this research was to better understand attitudes and awareness towards HIV prevention and care. The project aimed to recruit 75 physicians and 25 nurses. The study was launched with the goal of achieving maximum completions.

The soft launch was successful due to the robust data we had. However, progress slowed when targeting Nurse Practitioners from the Ontario region. Despite this challenge, we successfully fulfilled the quota with the support of data mining, a referral program, P2W efforts, and regular reminders. As a result, the project was completed on schedule. Respondents in this survey may have been exposed to information that is proprietary and confidential. This information was shared strictly for research purposes only.

CLIENT FEEDBACK

The client appreciated our efforts as we successfully closed the study on time.
