**100 Pediatricians USA,
50 Pediatricians Canada**

TARGET
RESPONDENTS

STUDY BACKGROUND

This study targeted pediatricians across the USA and Canada. A total of 100 respondents from the USA and 51 respondents from Canada participated in the survey online over a period of 15 days, from December 3, 2024, to December 17, 2024.

The purpose of this research is to better understand the effectiveness of current over-the-counter analgesic and antipyretic active ingredients in addressing the symptomatic needs of pediatric patients across different age groups.

To encourage participation and acknowledge the value of participants' time, incentives were provided upon completion of the 10-minute survey.

BUSINESS OBJECTIVE

The primary objective of any business is to generate profits. Therefore, our goal is to increase profitability by controlling operational costs and the cost per interview.

Additionally, since this industry is highly competitive among research vendors - where earnings are directly linked to the number of completed surveys - it is logical to focus on maximizing the number of completed responses to enhance profitability.

RESEARCH OBJECTIVE

This research aimed to identify the three most common types of pain encountered in pediatric patients and assess the effectiveness of current over-the-counter analgesic and antipyretic active ingredients in addressing their symptomatic needs across different age groups.

OPERATIONAL CHALLENGES

While successfully completing this project, we encountered a few challenges. In Canada, the required number of completes was relatively low, and we were able to achieve the target with minimal difficulty using the available database.

However, in the USA, meeting the regional quotas posed a challenge, particularly in the West and Midwest regions, which were difficult to close toward the end. Despite this, with the support of data mining, referral programs, and P2W efforts, we successfully achieved the required number of completes.

SAMPLE SIZE

100 Pediatricians USA,
50 Pediatricians Canada

OUR APPROACH TO OPERATIONAL CHALLENGES

We began with an email invitation campaign and later incorporated P2W efforts. Instead of sending mass invitations to all potential respondents, we invited them in batches to ensure a more controlled and effective approach.

To validate the study’s functionality, we conducted a soft launch before full deployment. As part of our strategy, we implemented P2W efforts and had a contingency plan to introduce customized invitations in case of slow response rates.

Additionally, we launched a referral campaign, which significantly contributed to completing the project ahead of schedule.

EXECUTIVE SUMMARY

The purpose of this research was to assess the effectiveness of current over-the-counter analgesic and antipyretic active ingredients in addressing the symptomatic needs of pediatric patients across different age groups. The project aimed to gather responses from 100 pediatricians in the USA and 50 pediatricians in Canada.

The project was launched with the goal of achieving maximum completes. The soft launch was successful based on the available data. However, there were challenges in achieving the required number of completes for USA pediatricians, particularly due to region - specific quotas. Despite the slow progress, we successfully met the target through data mining, referral programs, P2W efforts, and regular reminders, ensuring the project was completed on schedule.

Additionally, respondents in this survey may have been exposed to proprietary and confidential information, which was shared exclusively for research purposes.

CLIENT FEEDBACK

The client appreciated our efforts as we successfully completed the study on time.
